

## The defect

When the Sleepio on boarding system asks for the user's birthdate, chaos can ensue if the user chooses any of the following days 29, 30, or 31.

## Reproduction steps

1. Go to [Onboarding Sleep Test - Sleepio](#)
2. Fill out the form until you get to the birthdate question.
3. Select October 30 for the month and day

**What is your date of birth?**

October ▼ 30 ▼ Select year ▼

People's sleep patterns change with age so knowing how old you are helps us interpret your sleep problems. Not to worry, we will maintain the privacy of this and any other health information you give us in compliance with the law and with our own [Privacy Policy](#)

CONTINUE

4. Select 1990 for the year
5. The birth date should update to October 2, 1990

**What is your date of birth?**

October ▼ 2 ▼ 1990 ▼

## Suggested ways to fix the defect

To fix this defect, we can implement a datepicker which would then insure accuracy for the user when selecting a day. In my opinion this would be the best course of action.

Another course of action we could also consider would be to remove the dates from the months for when they don't exist. For example removing day 31 from April, June, August, September, or November. This way might not be the best way to go because of February only containing 28 days except for leap years, but it would fit the UX that is currently available to the user.
